

## **Task 5 –Social Issue of Pollution of an Environment due to Factory Waste**

**Water Pollution:** Factories often discharge harmful chemicals into rivers and lakes, killing aquatic life and contaminating drinking water.

**Air Pollution:** Emissions from factories release greenhouse gases and particulates, causing climate change and respiratory issues among local populations.

**Soil Contamination:** Hazardous waste seeps into the soil, reducing agricultural productivity and entering the food chain, which affects human health.

**Health Impacts:** Pollution from factories leads to chronic diseases, especially respiratory and cardiovascular problems, affecting the well-being of communities.

**Economic Costs:** The degradation of natural resources impacts agriculture and fisheries, leading to economic losses for those who depend on these sectors.

**Regulatory Failures:** Inadequate enforcement of environmental regulations allows factories to continue polluting with impunity.

**Need for Action:** Stricter regulations, cleaner technologies, and community engagement are essential to mitigate pollution and protect our environment.
